

EXPERIMENTS ON CISCO PACKET TRACER (Simulation Tool):

EXP NO: 03

DATE: 30/07/2020

Aim:

To study the Packet Tracer tool installation and User Interface Overview

To understand environment of Cisco PACKET to design simple network.

INTRODUCTION:

A simulator, as the name suggests, simulates network device and its environment.

- 1) It allows you to model complex systems without the need for dedicated equipment.
- 2) It helps you to practice your network configuration and troubleshooting skills via computer.
- 3) It is available for both Linux & window desktop environments.
- 4) Protocols in Packet Tracer are coded to work and behave in the same way as they would on real hardware.

Analyse the behavior of network devices using CISCO PACKET TRACER Simulator.

- 1) From the network component box, click and drag-and-drop the below component:
 - a) 4 Generic PCs and One HUB
 - b) 4 Generic PCs and One Switch
- 2) Click on Connections:
 - a) Click on Copper Straight-Through Cable.
 - b) Select one of the PC and connect it to HUB using the Cable. The link LED should glow in green, indicating that the link is up.
 - c) Similarly connect 4 PCs to the Switch using copper straight-through Cable.
- 3) Click on the PCs connected to hub, go to Desktop tab, click on IP configuration and enter an IP address and subnet mask.
Click on the PDU (message icon) from the command tool the HUB box,
 - a) Drag and drop it on one of PC (Source machine) and then drop it on another PC (destination machine) connected to the HUB

4) observe the flow of PDU from source PC to destination PC by selecting Realtime mode of simulation.

5) Repeat step #3 to step #5 for the PCs connected to the switch.

6) observe how HUB and Switch are forwarding the PDU and write your observation and conclusion about the behaviours of switch and HUB.

The LAN was implemented

Result: The packet tracer is learned and executed successfully.
